

Helping You to Grow

Bridge e-info: Product & Services Overview

January 2008

Project Design & Layout:

The Bridge team have many years experience of working within the British Horticultural Industry. We have full in-house design and build capability and a real enthusiasm for the industry. This enables us to offer the very best assistance possible in helping you to plan out your own nursery development, think through the issues and options involved, and plan wisely for both present and future needs. These decisions will effect the smooth running and efficiency of the nursery for many years to come, so must not be taken lightly. With modern CAD facilities, and experience on our side, Bridge are here to help you make those decisions easier.

Boiler House & Heating System Design:

The use of heating within a glasshouse is essential for the majority of crops in order to produce a quality crop. Bridge can provide full design and installation of all types of heating systems, including pipe heating, warm air, floor and lifting pipe systems. Boiler house, Co2 and heat storage pipe work and design is a speciality. We have many years experience with all types of boilers including: gas, oil, wood, and coal.

Screen & Bench Installations:

In recent years the use of screens and bench systems to create an economic use of both space and energy has become an essential ingredient to successful growing. Modern materials enable the perfect growing climate and can provide huge energy savings. A Bridge designed mobile bench & transport system will maximize your production and labour costs.

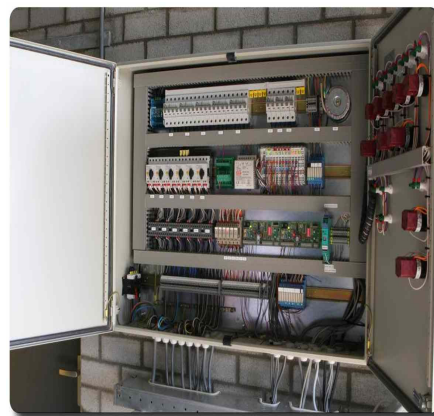

Climate & Irrigation Control Systems:

A modern glasshouse cannot compete in today's tough markets, without being very efficient in terms of maximising yield and minimising energy consumption. These ways of increasing profitability can only be realistically achieved by using a modern state-of-the-art environmental control computer. Bridge can offer a wide range of system options, to match all your climate and irrigation control system wishes. We will help you to design a computer installation, to ensure that all your installed nursery equipment is compatible and effectively integrated.

Control Panel Design & Construction:

A custom-built control panel, is the natural integration point for all controlled items installed within your nursery complex. The interfacing and control for all installed equipment can brought back to either a de-central or centralised panel design arrangement. At this access-control point the user can simply choose between 'automatic' or 'manual' control. A Bridge designed panel, will provide an easy access control point, and the ultimate in control flexibility.

Electrical & Irrigation Works:

The combination of being able to design and install all your nursery electrical and irrigation requirements, enables Bridge to offer a level of service and support rarely found within the (UK) horticultural industry. What ever your requirements are, the design team at Bridge will guide and assist you in making the correct selection of materials, products and installation methods, however simple or complex your requirements are.
